

ServiceNow administration Script-Controlled ACL – Restrict Record Access Based on Field Value

Technology: ServiceNow - Flow Designer

Role/Project Area: ServiceNow Administrator

PHASE 1 - Brainstorming & Ideation Phase

GitHub file: [Phase-1_Brainstorming-and-Ideation.pdf](#)

Phase Objective

Define the problem, identify the users, and decide how Flow Designer can automate ticket classification.

Problem Statement

Service desk teams may receive many incident tickets with different descriptions. Manually reviewing every ticket and deciding its category or assignment can take time and may lead to inconsistent classification.

Project Idea

The project uses ServiceNow Flow Designer to automatically classify newly created incident tickets using predefined conditions. Based on information such as the ticket description or category, the flow can set suitable classification fields and support consistent ticket handling.

Target Users

ServiceNow administrators, service desk teams, and support staff who manage incident tickets.

Main Objective

Reduce repetitive manual classification work, improve consistency, and demonstrate workflow automation using Flow Designer.

Screenshot Evidence

The screenshot below is the single screenshot supplied for this submission.

Important: The supplied screenshot shows the ServiceNow Institution Details list. It is not a Flow Designer screen. For the final Auto Ticket Classification submission, replace it with a Flow Designer/Incident screenshot if your faculty requires project-specific evidence.

Screen Recording Required

30-60 seconds: show the project title and explain the problem and idea.

Submission Checklist

- Save this PDF in the matching Phase folder in the public GitHub repository.
- Keep the screenshot readable and make sure important ServiceNow fields are visible.
- Do not show passwords, credentials, API keys, or confidential information.
