

ServiceNow administration Script-Controlled ACL – Restrict Record Access Based on Field Value

Technology: ServiceNow - Flow Designer

Role/Project Area: ServiceNow Administrator

PHASE 2 - Requirement Analysis Phase

GitHub file: [Phase-2_Requirement-Analysis.pdf](#)

Phase Objective

Convert the project idea into clear functional and non-functional requirements.

Functional Requirements

The system shall accept incident tickets, start the flow when the selected incident event occurs, evaluate predefined conditions, classify the ticket, update the required incident field, and allow the result to be verified.

Non-Functional Requirements

The solution should be simple to maintain, consistent, easy to test, and suitable for a ServiceNow administrator.

Inputs

Incident information such as short description, description, category, subcategory, impact, urgency, or other fields selected for the classification rules.

Output

A classified incident record with the selected field values updated automatically by the flow.

Screenshot Evidence

The screenshot below is the single screenshot supplied for this submission.

Important: The supplied screenshot shows the ServiceNow Institution Details list. It is not a Flow Designer screen. For the final Auto Ticket Classification submission, replace it with a Flow Designer/Incident screenshot if your faculty requires project-specific evidence.

Screen Recording Required

30–60 seconds: show the Incident form and explain the fields used as inputs/outputs.

Submission Checklist

- Save this PDF in the matching Phase folder in the public GitHub repository.
- Keep the screenshot readable and make sure important ServiceNow fields are visible.
- Do not show passwords, credentials, API keys, or confidential information.
