

# ServiceNow administration Script-Controlled ACL – Restrict Record Access Based on Field Value

Technology: ServiceNow - Flow Designer

Role/Project Area: ServiceNow Administrator

## PHASE 3 - Project Design Phase

GitHub file: [Phase-3\\_Project-Design.pdf](#)

### Phase Objective

Design the flow structure, decision logic, inputs, outputs, and data movement before development.

### System Design

The project is designed around an Incident record trigger. When a new incident is created, Flow Designer evaluates the selected conditions and performs an Update Record action to classify the incident.

### Flow Structure

Trigger → Classification Conditions → Matching Action → Update Incident Record → Test/Verify Result.

### Example Classification Logic

If the incident contains a defined keyword or selected category, the flow assigns the corresponding classification. The exact conditions should match the rules implemented in your ServiceNow instance.

### Design Benefit

A visual Flow Designer design makes the automation easier to understand and maintain.

### Screenshot Evidence

The screenshot below is the single screenshot supplied for this submission.

Important: The supplied screenshot shows the ServiceNow Institution Details list. It is not a Flow Designer screen. For the final Auto Ticket Classification submission, replace it with a Flow Designer/Incident screenshot if your faculty requires project-specific evidence.

## Screen Recording Required

45-90 seconds: explain the planned Flow Designer structure from Trigger to Classification to Update.

## Submission Checklist

- Save this PDF in the matching Phase folder in the public GitHub repository.
- Keep the screenshot readable and make sure important ServiceNow fields are visible.
- Do not show passwords, credentials, API keys, or confidential information.
