

ServiceNow administration Script-Controlled ACL ? Restrict Record Access Based on Field Value

PHASE 5 - Project Development Phase

Technology: ServiceNow - Flow Designer | Role/Project Area: ServiceNow Administrator

Phase Objective

Implement the Auto Ticket Classification flow in ServiceNow Flow Designer.

Development Steps

Open Flow Designer; create a meaningful flow name; add a Record trigger for the Incident table; configure the trigger; add classification conditions; add an Update Record action; set the classification field/value; save; test; and activate after successful verification.

Trigger

Use a record trigger on the Incident table. A Created trigger is suitable when classification should happen when a new incident is created.

Actions

Use conditions to determine which classification rule matches and an Update Record action to write the result back to the incident.

Development Result

The completed flow should automatically process a test incident and update the intended classification field.

Screenshot Evidence

The screenshot below is the single screenshot supplied for this submission.

Important: The supplied screenshot shows the ServiceNow Institution Details list. It is not a Flow Designer screen. For the final Auto Ticket Classification submission, replace it with a Flow Designer/Incident screenshot if your faculty requires project-specific evidence.

Screen Recording Required

2–4 minutes: show Flow Designer, the trigger, conditions/actions, test, and result.

Submission Checklist

- Save this PDF in the matching Phase folder in the public GitHub repository.
- Keep the screenshot readable and make sure important ServiceNow fields are visible.
- Do not show passwords, credentials, API keys, or confidential information.
