

ServiceNow administration Script-Controlled ACL ? Restrict Record Access Based on Field Value

PHASE 7 - Project Documentation Phase

Technology: ServiceNow - Flow Designer | Role/Project Area: ServiceNow Administrator

Phase Objective

Prepare the final written explanation of the project so another person can understand and reproduce it.

Project Overview

This project demonstrates an automated ticket-classification process in ServiceNow using Flow Designer. The flow monitors the selected Incident record event, evaluates configured conditions, and updates the incident with the required classification.

Technology Used

ServiceNow Platform; Flow Designer; Incident table; Record Trigger; Conditions/Flow Logic; Update Record action.

Benefits

Reduces repetitive manual work, provides consistent rule-based classification, improves process visibility, and demonstrates low-code workflow automation.

Repository Evidence

Keep the eight phase PDFs, screenshots, test evidence, and permitted supporting project files inside clearly named GitHub folders. Do not upload passwords, API keys, or confidential credentials.

Screenshot Evidence

The screenshot below is the single screenshot supplied for this submission.

Important: The supplied screenshot shows the ServiceNow Institution Details list. It is not a Flow Designer screen. For the final Auto Ticket Classification submission, replace it with a Flow Designer/Incident screenshot if your faculty requires project-specific evidence.

Screen Recording Required

60–90 seconds: give a documentation walkthrough of objective, technology, flow, testing, and result.

Submission Checklist

- Save this PDF in the matching Phase folder in the public GitHub repository.
- Keep the screenshot readable and make sure important ServiceNow fields are visible.
- Do not show passwords, credentials, API keys, or confidential information.
